Intake target: January 2027

Bachelor’s Degree Sponsorship Proposal
Artificial Intelligence and Machine Learning

THE REQUEST

I seek a sponsor to fund a Bachelor’s degree in Artificial Intelligence and Machine Learning (January 2027 intake). I already hold a Certificate and Diploma in Computer Science (UDSM). A second Computer Science bachelor would repeat that work. Cybersecurity is available locally but does not match my fintech, full-stack, and mobile delivery path. I cannot self-fund the nearest January intakes (Malaysia, Mauritius, United Kingdom).

1. CANDIDATE AT A GLANCE

Name / nationality	Sarah George Gordon · Tanzanian · Female · DOB 24 April 2004
Education (completed / in progress)	Certificate in Computer Science, UDSM (2023–2024, 1 year). Diploma in Computer Science, UDSM (2024–2026, 2 years — finalist).
Current work	Full Stack Developer (full-time), iMart Group LTD — LipaPay, SMS portal, imartListener, ELMS. Cofounder, TechMorah Solution LTD.
Recent contract (ended)	Craft Silicon — Support & Implementation Resource Engineer, part-time, 3 months (15 May 2026 – 11 August 2026). Banking channels, APIs, SQL Server.
Proven delivery	Fintech: LipaPay Portal, Airtime, Disbursement, Sandbox (iMart Group). Enterprise SMS: Victoria Lush portal + Linux VPS; imartListener (Flutter). E-commerce: Active Targets (activetargets.org). 25+ projects in public portfolio.
Evidence (no extra briefing needed)	Portfolio: sarahgordon895.github.io/sarahgordon.github.io Company: sarahgordon895.github.io/TechMorah GitHub: github.com/SarahGordon895 · CV attached

2. WHY THIS DEGREE — AND NOT THE LOCAL ALTERNATIVES

Not another Computer Science bachelor

Tanzania’s common next step after diploma is a CS bachelor. That path largely repeats certificate + diploma content I have already studied and applied in production for three

Not Cybersecurity as the primary bachelor

Cybersecurity is valuable, but my daily work is product build and implementation: payments, SMS platforms, banking channels, APIs, and mobile. AI/ML sits on that stack. Security remains a practice I already apply in

years. It would cost time without adding the depth my career now needs.

production hardening — it is not the degree that multiplies my current expertise.

Why Artificial Intelligence and Machine Learning: I already ship full-stack web, Flutter mobile, payment APIs, and banking support. AI/ML is the missing formal layer that lets me design intelligent products in fintech and enterprise — fraud signals, credit/ops scoring, chatbot/copilot systems, document and transaction intelligence — at corporate standard, not only as a self-taught add-on. Global demand and East African digital finance both move in this direction. The degree polishes theory I cannot get from repeating CS or from a cyber-first bachelor.

3. FIT WITH INDUSTRY AND RETURN ON SPONSORSHIP

- **Fintech (now):** Full-time Full Stack Developer at iMart Group — LipaPay live platforms, SMS desk, and production support.
- **Banking support (completed):** Craft Silicon part-time contract (3 months, ended 11 August 2026) — bank channels and SQL/API root-cause work.
- **Build + implement (now):** Laravel/Filament, Flutter, Linux VPS and shared hosting, staff handover, documentation.
- **After the degree:** Same delivery, with formal AI/ML — higher-value systems for Tanzanian and regional institutions, TechMorah client work, and employability at corporate fintech level.
- **Accountability:** Term reports, transcripts, and a short progress note to the sponsor each semester. Public portfolio remains the proof of applied skill.

4. WHERE I CAN STUDY (JANUARY INTAKE) AND COST BARRIER

Closest January intakes identified: **Mauritius, Malaysia, United Kingdom**. Approximate tuition I have researched (TZS, per academic year; living costs extra):

Destination	Indicative tuition / year	Affordability
Mauritius	TZS 35.3 million – 44.2 million	Beyond personal means
Malaysia	TZS 46.3 million – 67.4 million	Beyond personal means
United Kingdom	Typically higher than Malaysia (fees + living)	Beyond personal means

Figures are indicative from current programme research and will be confirmed against the official offer letter. Living, visa, insurance, and flights are additional. I will accept the most cost-effective accredited AI/ML bachelor that starts January 2027.

5. FUNDING REQUESTED

Preferred programme type	Bachelor's in Artificial Intelligence and Machine Learning (or equivalent: AI, Data Science & ML) — accredited university, January 2027.
Preferred cost order	1) Mauritius 2) Malaysia 3) United Kingdom — whichever issues a firm offer I can complete on time.
What I ask the sponsor to cover	Option A (full): Tuition + mandatory fees for the full bachelor (typically 3 years) + reasonable living, visa, insurance, and one return airfare per year. Option B (tuition only): Full tuition and university fees; I cover or co-fund living where possible. Option C (partial): Any committed annual amount that unlocks an offer

	(e.g. 50% tuition); I will seek the remainder from other partners with your knowledge.
Indicative full-tuition range (3 years)	Mauritius: about TZS 106 – 133 million tuition only. Malaysia: about TZS 139 – 202 million tuition only. Living and visa extra — to be itemised on the university offer.
My contribution	Application fees where affordable; continued professional work in holidays if the visa allows; complete academic effort; no change of course without sponsor consent.

6. HOW A SPONSOR CAN DECIDE QUICKLY

1. Review this one document (purpose, gap, ask).
2. Open portfolio and GitHub (proof of delivery, not promises).
3. Read the attached CV (roles, referees, education).
4. Confirm interest → I submit applications and share offer letters + exact fee schedules for your approval before any payment.

No verbal briefing should be required. The record of work is public. The academic case is simple: **three years of CS already done; the next three years must add AI/ML, not repeat CS or divert into a cyber-first bachelor that does not match fintech product engineering.**

7. CLOSING

I am a working engineer from Dar es Salaam with a clear path: certificate → diploma → production fintech and banking systems → bachelor in AI and Machine Learning. I am not asking to start computing from zero. I am asking for the one qualification that upgrades what I already ship. I will honour any sponsorship with transparency, results, and service to Tanzania's digital and financial sector after graduation.

I am available for a short call and will provide any additional document (admission forms, fee invoices, passport, transcripts) on request.
